

How to Make an Academic Poster

A guide to the build-poster-pdf card types(build-poster-pdf)

Each box below demonstrates one feature. See SKILL.md for the full reference.

The title band

- `title / author / institute / note` come from the YAML header, not the body.
- They are combined into the green title band at the top, spanning the full width.
- The body starts with the first `#` heading.

One heading, one box

- `# 見出し` becomes one rounded green box.
- The heading text is the box title.
- Everything until the next `#` is the box body.

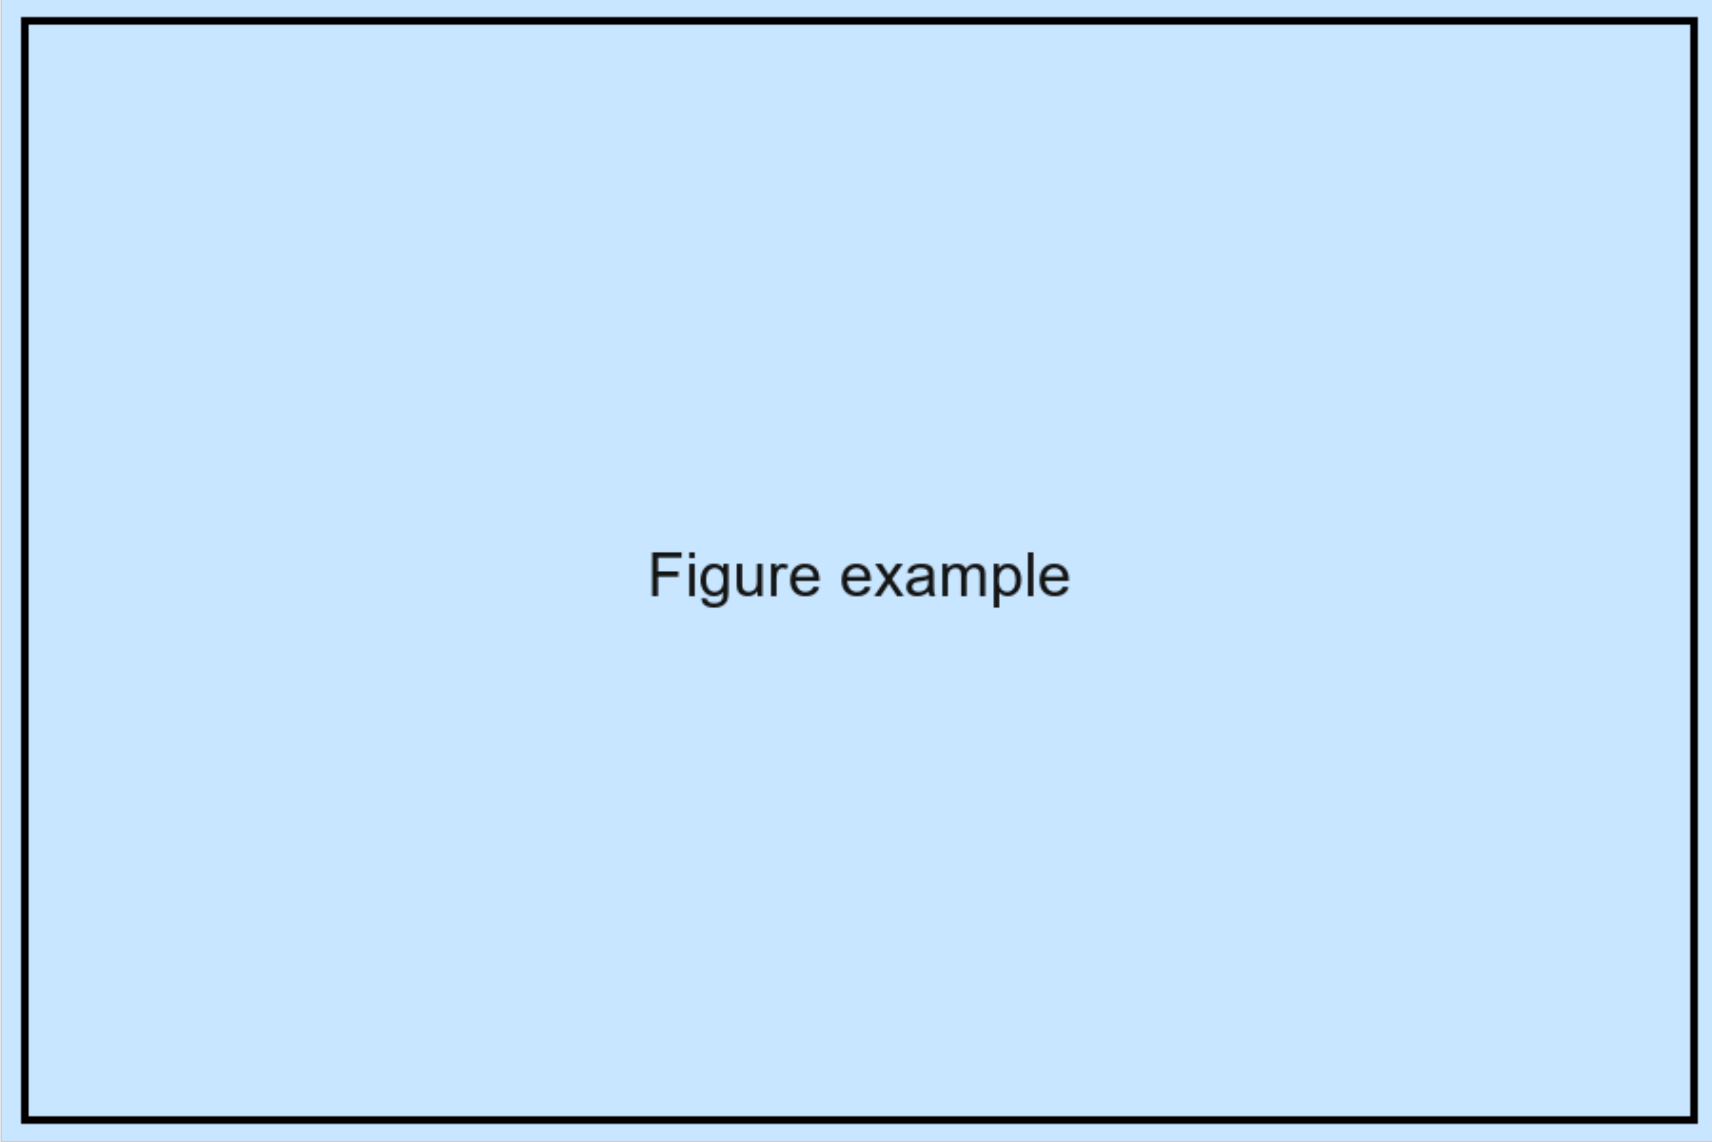

Default layout: flow

- Without a `layout:` key in the header, boxes flow newspaper-style.
- Left column fills top to bottom, then the right column.
- `-Columns N` changes the number of columns (default 2).

A table box

Feature	How to write it
Box	<code># heading</code>
Full-width box	<code># heading {.full}</code>
Grid layout	<code>layout:</code> in the header
Image row	<code>::: row ... :::</code>

A figure box

A standalone image paragraph is wrapped in `div.fig` automatically, so its `max-height` is respected and it never blows out the box.

A photo row

Images inside `::: row ... :::` line up side by side. **Separate them with a blank line**, or they merge into one figure.

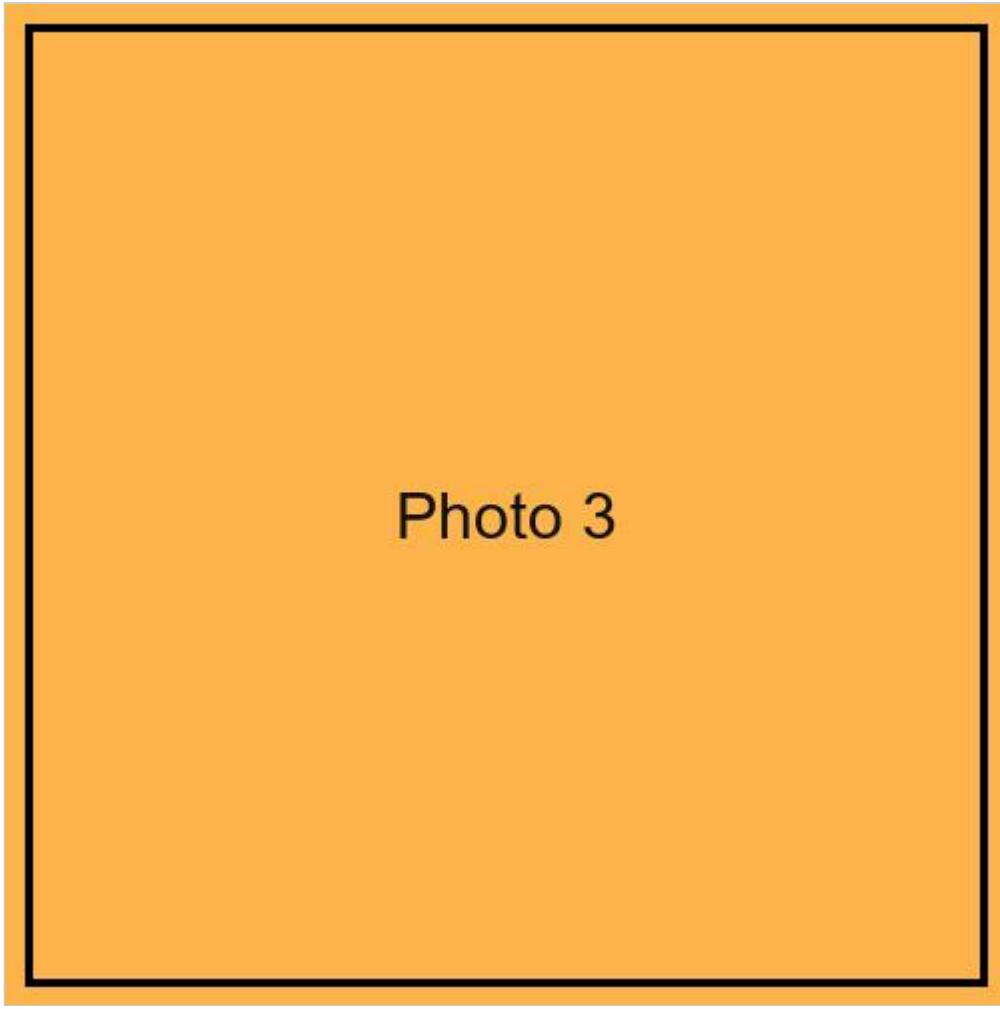

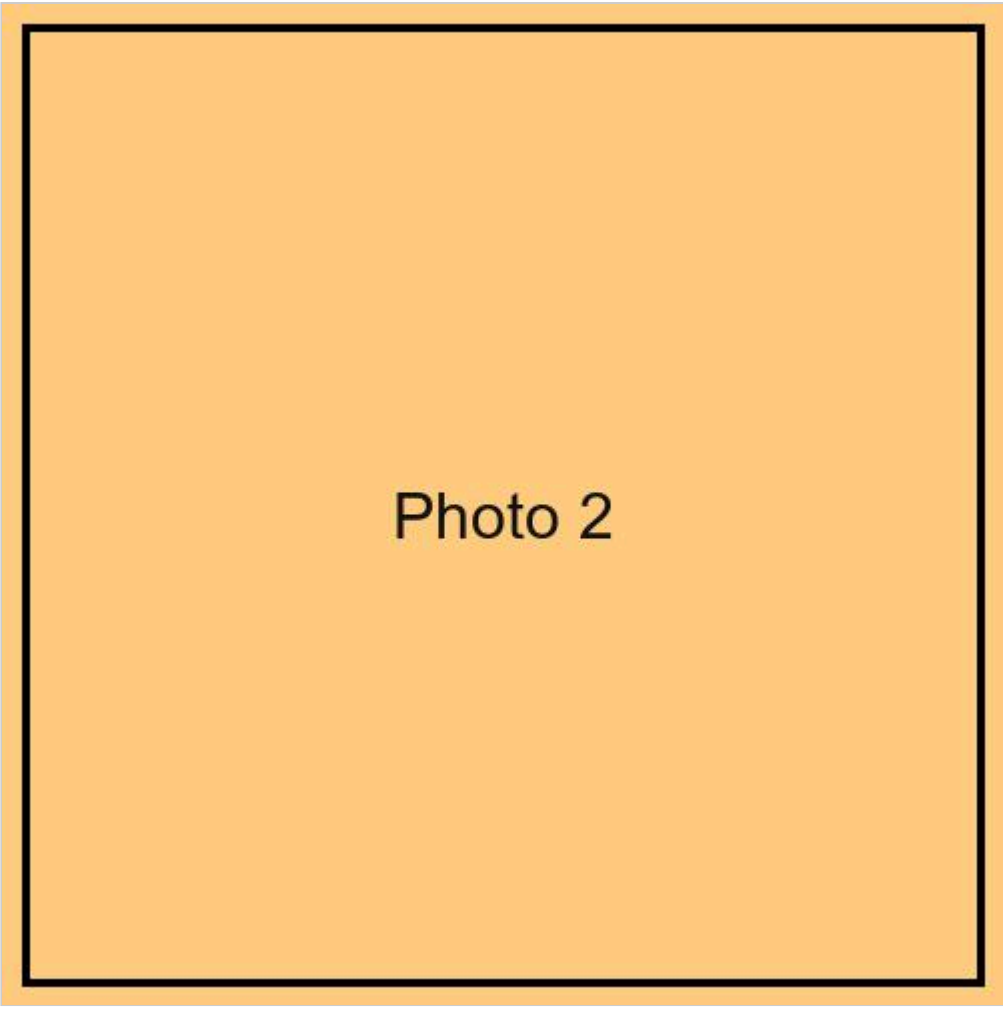

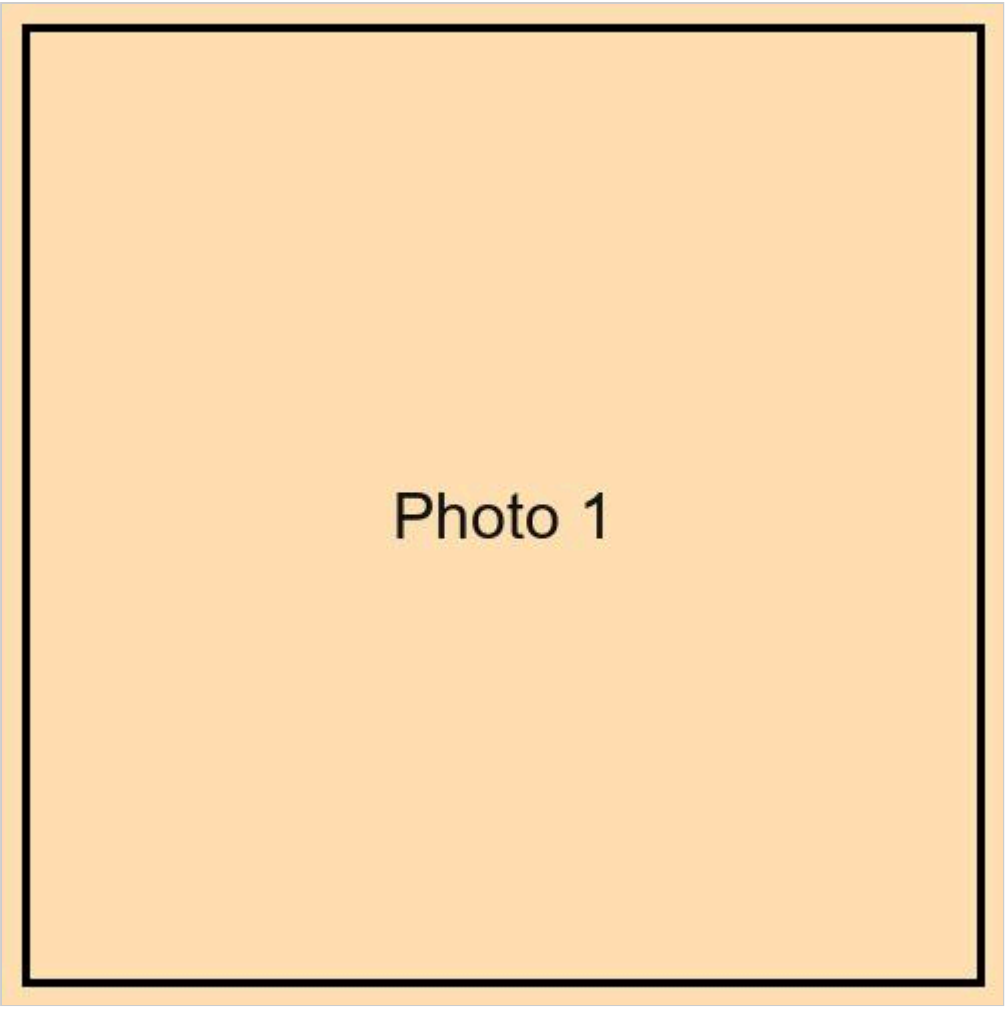

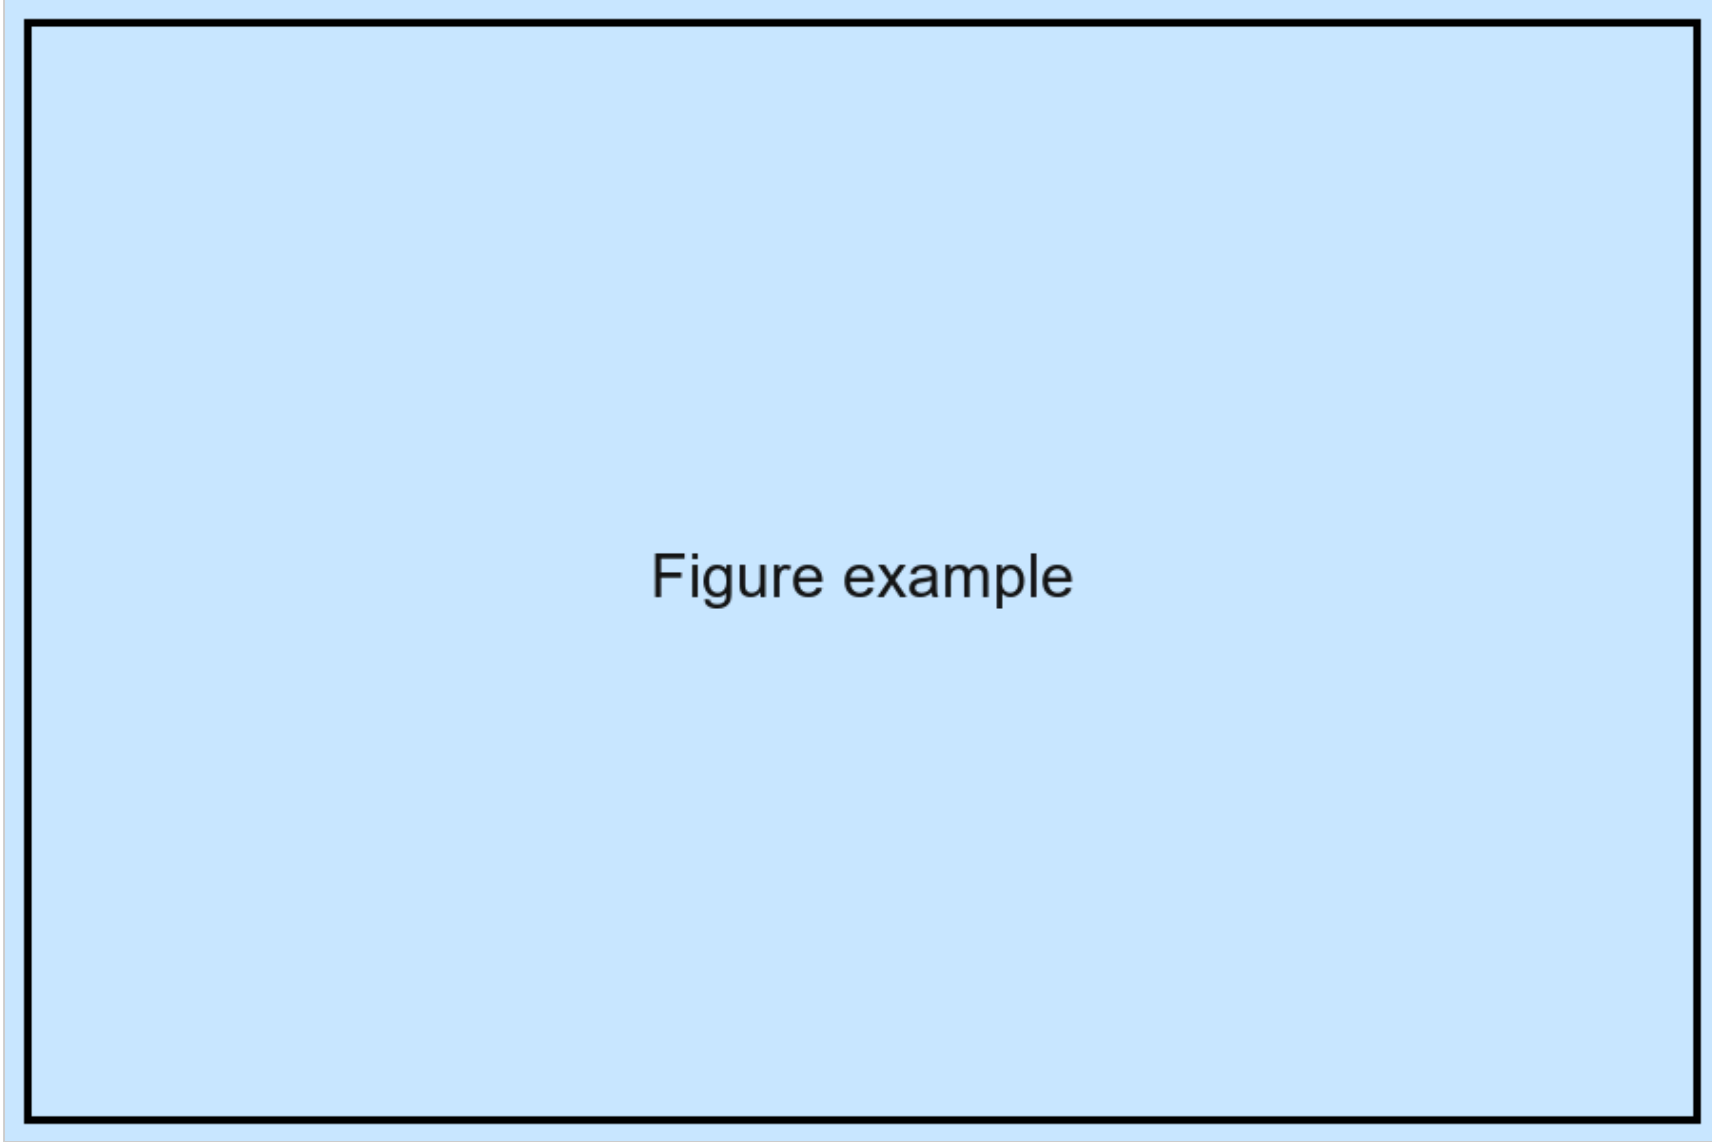

Image typo rescue

The line above uses `[..](file.png)` (no `!`), a common typo. It is still rendered as an image because the extension is a known image type.

Where to go next

See `../golf_course.md` in this same directory for a realistic example that uses the `layout:` header key (CSS Grid mode) to place boxes in an irregular arrangement, matching the sample `poster.pdf` at the project root.
