

build-poster-pdf: input to output

A cheat sheet of the build-poster-pdf syntax(build-poster-pdf)
Left column: what you write in the .md. Right column: what comes out. See poster_howto.md for a feature tour instead.

Header input

```
---
title: "My Poster"
author: ["Jane Doe"]
institute: ["Example Univ."]
note: "A short note"
type: "学術ポスター"
---
```

Header output

My Poster

Jane Doe(Example Univ.)
A short note

The title band always spans the full width, above every box.

Bullet list input

```
- First point
- Second point
  - Nested point
```

Bullet list output

- First point
- Second point
 - Nested point

Table input

```
| Item | Value |
|---|---|
| A | 1 |
| B | 2 |
```

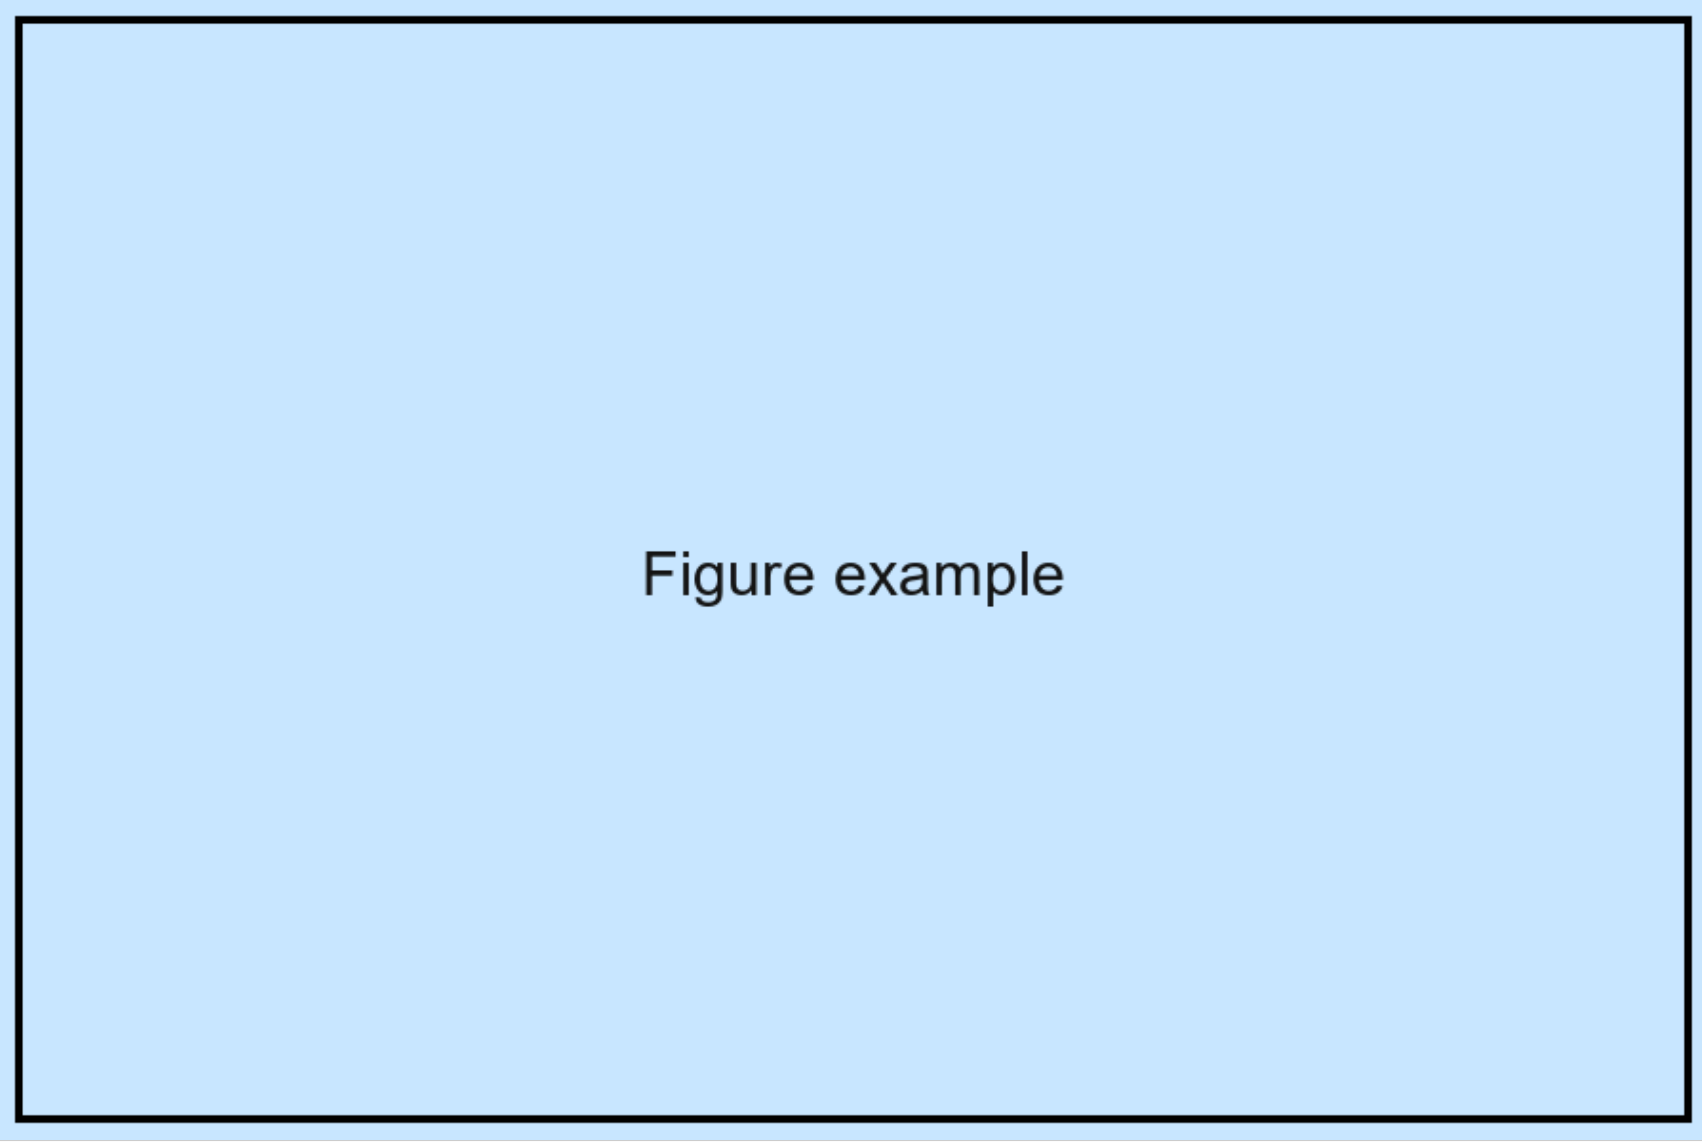

Table output

Item	Value
A	1
B	2

Figure input

```
![Figure example](../images/howto_fig.png)
```

Figure output

Layout 2 columns input

No `layout:` key, so boxes flow newspaper-style (left column top to bottom, then the right column).

```
---
title: "..."/>

```

Layout 2 columns output

Boxes fill the left column first, then the right column.

A

B

C

Layout 1 column input

Add `{.full}` right after the heading text (only used when `layout:` is absent; with `layout:`, a single-item row is already full width).

```
# BOX D {.full}
...
```

Layout 1 column output

That one box spans the full width, breaking out of the 2-column flow (used for wide tables or a summary that should not be split).

D (full width)

For an irregular arrangement, use `layout:` (a matrix of headings) or `grid:` (x/y/w/h per box) – see `../golf_course.md`.
